

ShoeSaver

This website is going to be designed for entrepreneurs in the shoe resale industry. The goal of this website is to allow clients to maintain and track their inventory. As someone who used to work in this industry, I always struggled to keep track of my inventory in long excel spreadsheets that I never wanted to maintain. By creating a user-friendly interface, I hope to make inventory management an easy and enjoyable experience. The user will be able to enter in the relevant information to keep track of their shoes. The site will be split into 2 main parts. One part will keep track of the active inventory, and the other part will keep track of the sold inventory. This will allow users to easily calculate revenue and profits as well as inventory that needs to be moved.

Page Names:

- Home Page
- About Us
- Active Inventory List
- Sold Inventory
- Shoes
- Clothing

Data

I will be storing data about the shoe. This includes:

- SKU
- Brand
- Price
- Size
- Quantity
- Date of Entry
- Price Bought
- Price Sold

The user will need to login to his account to get access to his data and have the ability to add, delete, and edit the inventory list. The user will be able to add as many items as they

want to allow efficient entry. If time allows, I will create the option to allow the importation of data from spreadsheets/csv files to allow for even faster and more convenient data entry that will make it easier for users to switch to this platform for their inventory management needs.
